

## Who is Cedrus?

We're a professional services firm that designs, architects, implements, and manages technology-powered solutions for the digital age. Our Cloud Security practice advises organizations on how to safely embrace the Cloud. The on-premise to cloud journey creates new vulnerabilities that need be addressed by:

- Creating the right policies and procedures
- Effectively monitoring and managing cloud activity
- Implementing the appropriate technologies to enforce the necessary security controls

## Our Partnership with Netskope

As a trusted Netskope partner, we help customers:

- Select the right components in the Netskope platform to meet requirements
- Implement the technology to meet standards & integration specifications
- Establish governance oversight and process models to make the implementation effective

## THE CHALLENGE

Netskope implementations must provide the security and compliance you require. Let the Cedrus certified Netskope experts help.

Netskope's Cloud Security platform requires ongoing monitoring, tuning, and maintenance to advance capability and performance. The evolution of your organization in the cloud and increasing compliance requirements make this more critical than ever. Limited resources or skills in IT security often move this vital activity to the back burner to focus on other important and urgent security challenges. For many customers, the Netskope solution has not been reviewed or evolved beyond the initial activation services.

## COMPREHENSIVE ANALYSIS AND REPORT

Cedrus certified experts will review your Netskope implementation to determine if use case requirements are properly met. We will then analyze the configuration for inconsistencies and risks based upon implementation patterns learned through our extensive experience delivering cloud security services to Netskope clients.

This review will identify ways that you can increase compliance, secure access, secure the edge / move toward zero trust, reduce risk of data leakage, reduce malware threat, and minimize Infrastructure-as-a-Service (IaaS) configuration vulnerabilities.

## DELIVERY

The Assurance Review is a 2 hour review of your Netskope configuration with an output report of overall maturity with recommendations and opportunities in topics including:

- Settings and Configurations
  - Administration and security settings
  - Traffic steering, secure edge, and client for real-time protection
  - SSO and SAML proxy integration
  - API integration and threat management
  - Quarantine and legal hold
  - On-Prem components
- Policies and Profiles
  - Real-Time protection
  - Security assessment
- Alert / Incident Handling
  - DLP incidents and forensics
  - Anomalies, malware, and compromised credentials
- Reports and Queries
  - Leverage Netskope Skope IT console
  - Policy reporting
